

**ABSTRACT OF THE DISCLOSURE**

The present invention relates to a method for manufacturing a door mold and a door produced using a mold that is manufactured by the method. The method for manufacturing the door mold according to the present invention comprises a masking/sanding process of masking a non-etching area except an etching area of the mold and then finishing the etching area with sand to transfer a pattern on the etching area; a pattern forming process for forming the pattern on the etching area of the mold; a mesh forming process of forming a mesh on the etching area of the mold; a polishing process of performing polishing treatment by spraying glass beads on the etching area such that the degree of polish of the etching area can be uniformly maintained; and a mask removal/inspection process of performing anticorrosive treatment on the surface of the mold. Further, there is provided a door produced using the mold that is manufactured by the method.
